

ANDREW SISON

SOFTWARE ENGINEER AT NORTHROP GRUMMAN

📞 (951) 818-4244 ✉ andrewsison19@gmail.com 🔗 linkedin.com/in/asison19 🐙 github.com/asison19

Experience

Northrop Grumman

January 2020 - Present

Software Engineer

- Stress-tested a Qt (C++) satellite simulation client and refactored client to use a single GUI thread in lieu of multiple threads that were causing crashes, reducing the amount of crashes by ~80 per month per client.
- Redesigned satellite simulation client to have a drop-down of satellite simulations, with a tooltip feature to organize telemetry with respect to the simulation in question.
- Designed a close-to-plain-English grammar for a transpiler to target HashiCorp Packer to avoid the overhead costs associated with maintaining hand-written configurations, potentially saving the enterprise in the order of hundreds of thousands of dollars.
- Using Ansible, automated and hardened deployments of tooling such as Docker, Kubernetes, Jira, and Bamboo, minimizing deployment times for internal teams from weeks to hours.
- Leveraged Molecule to write automated unit tests of Ansible code, and automated the provisioning of Docker Desktop, allowing containerized Molecule unit testing for Windows, saving at least 80 developer hours per month, quantified by the amount of bugs reported by end users.
- Wrote Jenkins shared library logic to resolve nondeterminism in HashiCorp Packer build errors in nightly builds, increasing the amount of passing builds by 50%.

Education

California State Polytechnic University, Pomona

December 2019

Bachelor of Science in Computer Science

Pomona, CA

- Big Data and Cloud Computing
- Data Structures and Algorithms
- Operating Systems
- Compiler Theory
- GUI Programming
- Parallel Processing

Projects

Lexical and Syntax Analyzer

- Wrote the Lexer and the Parser using JFlex and CUP and designed the grammar of the language.
- Created a Trie Table to hold keywords and identifiers, making search and insertion $O(\log_k n)$.
- Provided QA by fixing lexical rules, ensuring proper tokenization, and solving grammar ambiguities.
- Verified parsing of the input into lexemes, and wrote pattern definitions using regular expressions.
- Led team of 2, and taught partner Git, ensuring proper version control of the project.

Data Visualizations of Cal Poly Pomona

- Scripted in Python, along with NumPy, Pandas, and Matplotlib.
- Graphed visualizations of PM levels, temperature, and humidity by using the Pandas data frame API, and reading in csv files from Purple Air's public air quality sensors.

Skills

Languages: Bash, C++, Java, Python

Operating Systems: Linux, Windows 10

Tools: Ansible, Docker, Git, HashiCorp Packer, Jenkins, Kubernetes

Concepts: Agile Development, Compiler and Interpreter Design, DevOps, GitOps
